

《线性代数与解析几何》(A)试卷(17-18年度第1学期)

一、(15分) 填空题.

1. d 2. $\begin{pmatrix} \mathbf{0} & B^{-1} \\ A^{-1} & \mathbf{0} \end{pmatrix}$ 3. $\begin{pmatrix} 1 & n & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 2^n & 0 \\ 0 & 0 & 0 & 3^n \end{pmatrix}$ 4. $\begin{pmatrix} a & b \\ 0 & a \end{pmatrix}$ 5. 任意实数

二、(18分) 选择题:

1. A 2. D 3. D 4. A 5. C 6. C

三、(7分)计算行列式:

$$D = \begin{vmatrix} a + \frac{(n-1)(n+2)}{2} & 2 & 3 & \cdots & n \\ a + \frac{(n-1)(n+2)}{2} & a+1 & 3 & \cdots & n \\ a + \frac{(n-1)(n+2)}{2} & 2 & a+2 & \cdots & n \\ \vdots & \vdots & \vdots & & \vdots \\ a + \frac{(n-1)(n+2)}{2} & 2 & 3 & \cdots & a+n-1 \end{vmatrix} \quad (+3\text{分})$$

$$= \begin{vmatrix} a + \frac{(n-1)(n+2)}{2} & 2 & 3 & \cdots & n \\ 0 & a-1 & 0 & \cdots & 0 \\ 0 & 0 & a-1 & \cdots & 0 \\ \vdots & \vdots & \vdots & & \vdots \\ 0 & 0 & 0 & \cdots & a-1 \end{vmatrix} \quad (+3\text{分})$$

$$= \left[a + \frac{(n-1)(n+2)}{2} \right] (a-1)^{n-1} \quad (+1\text{分})$$

四、(15分) $\left(\begin{array}{ccccc|c} 1 & 1 & 1 & 1 & 1 & 7 \\ 3 & 2 & 1 & 1 & -3 & -2 \\ 0 & 1 & 2 & 2 & 6 & 23 \\ 5 & 4 & 3 & 3 & -1 & 12 \end{array} \right) \rightarrow \left(\begin{array}{ccccc|c} 1 & 1 & 1 & 1 & 1 & 7 \\ 0 & 1 & 2 & 2 & 6 & 23 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \end{array} \right) \rightarrow \left(\begin{array}{ccccc|c} 1 & 0 & -1 & -1 & -5 & -16 \\ 0 & 1 & 2 & 2 & 6 & 23 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \end{array} \right)$

$$\begin{cases} x_1 - x_3 - x_4 - 5x_5 = -16 \\ x_2 + 2x_3 + 2x_4 + 6x_5 = -2 \end{cases} \Rightarrow \begin{cases} x_1 = k_1 + k_2 + 5k_3 - 16 \\ x_2 = -2k_1 - 2k_2 - 6k_3 + 23 \\ x_3 = k_1 \\ x_4 = k_2 \\ x_5 = k_3 \end{cases}$$

通解: $\begin{pmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \\ x_5 \end{pmatrix} = k_1 \begin{pmatrix} 1 \\ -2 \\ 0 \\ 0 \\ 0 \end{pmatrix} + k_2 \begin{pmatrix} 1 \\ -2 \\ 0 \\ 1 \\ 0 \end{pmatrix} + k_3 \begin{pmatrix} 5 \\ -6 \\ 0 \\ 0 \\ 1 \end{pmatrix} + \begin{pmatrix} -16 \\ 23 \\ 0 \\ 0 \\ 0 \end{pmatrix}$

五、 (15 分)

$$(\varepsilon_1^T \quad \varepsilon_2^T \quad \varepsilon_3^T \mid \eta_1^T \quad \eta_2^T \quad \eta_3^T) = \left(\begin{array}{ccc|ccc} 1 & 1 & 1 & 1 & 2 & 3 \\ 0 & 1 & 1 & 2 & 3 & 1 \\ 0 & 0 & 0 & 3 & 1 & 2 \end{array} \right)$$

$$\rightarrow \left(\begin{array}{ccc|ccc} 1 & 0 & 0 & -1 & -1 & 2 \\ 0 & 1 & 0 & -1 & 2 & -1 \\ 0 & 0 & 1 & 3 & 1 & 2 \end{array} \right) \quad +5\text{分}$$

$$\text{从基 } \varepsilon_1, \varepsilon_2, \varepsilon_3 \text{ 到基 } \eta_1, \eta_2, \eta_3 \text{ 的过渡矩阵 } P = \begin{pmatrix} -1 & -1 & 2 \\ -1 & 2 & -1 \\ 3 & 1 & 2 \end{pmatrix}$$

设 ξ 在基 $\varepsilon_1, \varepsilon_2, \varepsilon_3$ 的坐标为 (x_1, x_2, x_3)

$$x_1 \varepsilon_1 + x_2 \varepsilon_2 + x_3 \varepsilon_3 = \xi$$

$$(\varepsilon_1^T, \varepsilon_2^T, \varepsilon_3^T, \xi^T) = \left(\begin{array}{ccc|c} 1 & 1 & 1 & 1 \\ 0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 1 \end{array} \right) \rightarrow \left(\begin{array}{ccc|c} 1 & 0 & 0 & 1 \\ 0 & 1 & 0 & -1 \\ 0 & 0 & 1 & 1 \end{array} \right) \quad +5\text{分}$$

$$(x_1, x_2, x_3) = (1, -1, 1)$$

所以, ξ 在基 $\varepsilon_1, \varepsilon_2, \varepsilon_3$ 的坐标为 $(1, -1, 1)$

设 ξ 在基 η_1, η_2, η_3 的坐标为 (y_1, y_2, y_3)

$$y_1 \eta_1 + y_2 \eta_2 + y_3 \eta_3 = \xi$$

$$(\eta_1^T, \eta_2^T, \eta_3^T, \xi^T) = \left(\begin{array}{ccc|c} 1 & 2 & 3 & 1 \\ 2 & 3 & 1 & 0 \\ 3 & 1 & 2 & 1 \end{array} \right) \rightarrow \left(\begin{array}{ccc|c} 1 & 0 & 0 & 1/9 \\ 0 & 1 & 0 & -2/9 \\ 0 & 0 & 1 & 4/9 \end{array} \right) \quad +5\text{分}$$

$$(y_1, y_2, y_3) = \left(\frac{1}{9}, -\frac{2}{9}, \frac{4}{9} \right)$$

$$\text{所以, } \xi \text{ 在基 } \eta_1, \eta_2, \eta_3 \text{ 的坐标为 } \left(\frac{1}{9}, -\frac{2}{9}, \frac{4}{9} \right)$$

六、 (10分)

$$\vec{n} = \begin{vmatrix} \vec{i} & \vec{j} & \vec{k} \\ 1 & -1 & 1 \\ 3 & 2 & -12 \end{vmatrix} = 10\vec{i} + 15\vec{j} + 5\vec{k} \quad (+6\text{分})$$

$$10(x-1) + 15(y-1) + 5(z-1) = 0$$

$$\text{平面方程: } 2(x-1) + 3(y-1) + (z-1) = 0 \quad (+4\text{分})$$

$$\text{即: } 2x + 3y + z - 6 = 0$$

七、(15 分)

(1)

$$|\lambda E - A| = \begin{vmatrix} \lambda-6 & -2 & -4 \\ -2 & \lambda-3 & -2 \\ -4 & -2 & \lambda-6 \end{vmatrix} = (\lambda-2)^2 (\lambda-11) \stackrel{\text{令}}{=} 0$$

特征值: $\lambda_1 = \lambda_2 = 2, \quad \lambda_3 = 11$

对 $\lambda=2$:

$$(\lambda E - A) = \begin{pmatrix} -4 & -2 & -4 \\ -2 & -1 & -2 \\ -4 & -2 & -4 \end{pmatrix} \rightarrow \begin{pmatrix} 2 & 1 & 2 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}$$

$$(\lambda E - A)X = 0 \text{ 的基础解系: } \alpha_1 = \begin{pmatrix} -1 \\ 2 \\ 0 \end{pmatrix}, \alpha_2 = \begin{pmatrix} -1 \\ 0 \\ 1 \end{pmatrix}$$

$$\text{对应 } \lambda=2 \text{ 的特征向量为: } \alpha_1 = \begin{pmatrix} -1 \\ 2 \\ 0 \end{pmatrix}, \alpha_2 = \begin{pmatrix} -1 \\ 0 \\ 1 \end{pmatrix}$$

对 $\lambda=11$:

$$(11E - A) = \begin{pmatrix} 5 & -2 & -4 \\ -2 & 8 & -2 \\ -4 & -2 & 5 \end{pmatrix} \rightarrow \begin{pmatrix} 1 & -4 & -1 \\ 0 & 2 & -1 \\ 0 & 0 & 0 \end{pmatrix}$$

$$(11E - A)X = 0 \text{ 的基础解系, 也是对应 } \lambda=11 \text{ 的特征向量: } \alpha_3 = \begin{pmatrix} 2 \\ 1 \\ 2 \end{pmatrix}$$

$$(2) \quad \alpha_1, \alpha_2 \text{ 正交化: } \beta_1 = \begin{pmatrix} -1 \\ 2 \\ 0 \end{pmatrix}, \quad \beta_2 = \begin{pmatrix} -1 \\ 0 \\ 1 \end{pmatrix} - \frac{1}{5} \begin{pmatrix} -1 \\ 2 \\ 0 \end{pmatrix} = \begin{pmatrix} -4/5 \\ -2/5 \\ 1 \end{pmatrix}$$

$$\beta_1, \beta_2, \alpha_3 \text{ 单位化: } \begin{pmatrix} -1/\sqrt{5} \\ 2/\sqrt{5} \\ 0 \end{pmatrix}, \begin{pmatrix} -4/3\sqrt{5} \\ -2/3\sqrt{5} \\ \sqrt{5}/3 \end{pmatrix}, \begin{pmatrix} 2/3 \\ 1/3 \\ 2/3 \end{pmatrix}$$

$$\text{得正交矩阵 } T = \begin{pmatrix} -1/\sqrt{5} & -4/3\sqrt{5} & 2/3 \\ 2/\sqrt{5} & -2/3\sqrt{5} & 1/3 \\ 0 & \sqrt{5}/3 & 2/3 \end{pmatrix}$$

$$\text{使得 } T^{-1}AT = \begin{pmatrix} 2 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 11 \end{pmatrix}$$

八、(5分)

证明: 因为 $r(A, \beta_i) = r(A)$

β_i 可以表示为 $\alpha_1, \alpha_2, \dots, \alpha_n$ 的线性组合, $i = 1, 2, \dots, k$

则 $\beta_1, \beta_2, \dots, \beta_k, \alpha_1, \alpha_2, \dots, \alpha_n$ 可以由 $\alpha_1, \alpha_2, \dots, \alpha_n$ 线性表示

所以, $r(A, B) \leq r(A)$

又 $r(A, B) \geq r(A)$

因此, $r(C) = r(A, B) = r(A)$
